3
4 * for i in range(3):
5 * for j in range(4):
6 c[i][j] = a[i][j] + b[j] 6 How do you vectorize this?

Correct c = a.T + b

c = a.T + b.T

c=a+b

element-wise product so c.shape will be (3, 3) Correct

You need to instead use np.dot(a,b)

10. Consider the following computation graph.

This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1). It will lead to an error since you cannot use "*" to operate on these two matrices.

This will invoke broadcasting, so b is copied three times to become (3, 3), and \ast

This will invoke broadcasting, so b is copied three times to become (3,3), and * is an

а u = a * b

С w = b + cWhat is the output J?

Yes. J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c).

J = (b-1)*(c+a)

J = (c - 1)*(b + a)

O D E

8. Consider the following code snippet:

 \bigcirc c = a + b.T

1 # a.shape = (3,4) 2 # b.shape = (4,1)

Consider the following code:

3 c = a*b

1 a = np.random.randn(3, 3)
2 b = np.random.randn(3, 1)

invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3,

What will be c? (If you're not sure, feel free to run this in python to find out).

b v = a * cJ = u + v - w

 $\int J = (a - 1) * (b + c)$

J = a*b + b*c + a*c
